

- **Write SQL query to solve the problem given below**

**Here we are talking about the Bank related information of a person.**

**For which you need to create three tables named as Bank, Account holder and Loan table.**

**And solve the problem stated below.**

**Create a Bank table, attributes are : branch id, branch name, branch city**

```
mysql> create table bank (branch_id int primary key, branch_name varchar(50), branch_city varchar(50));
```

**Create a Loan table, attributes are : loan no, branch id, account holder's id, loan amount and loan type**

```
mysql> create table account_holder (acc_holder_id int primary key, account_no varchar(20), acc_holder_name varchar(50), city varchar(50), contact varchar(15), date_created date, account_status varchar(15), account_type varchar(20), balance decimal(10,2));
```

**Create a table named as Account holder for the same scenario containing the attributes are account holder's id, account no, account holder's name, city, contact, date of account created, account status (active or terminated), account type and balance.**

```
mysql> create table loan (loan_no int primary key, branch_id int, acc_holder_id int, loan_amount decimal(10,2), loan_type varchar(20), foreign key (branch_id) references bank(branch_id), foreign key (acc_holder_id) references account_holder(acc_holder_id));
```

- **Consider an example where there's an account holder table where we are doing an intra bank transfer i.e. a person holding account A is trying to transfer \$100 to account B.**

**- for this you have to make a transaction in sql which can transfer fund from account A to B**

**- Make sure after the transaction the account information have to be updated for both the credit account and the debited account**

```
start transaction; update account_holder set balance = balance - 100 where account_no = 'a'; update account_holder set balance = balance + 100 where account_no = 'b'; commit;
```

- **Also fetch the details of the account holder who are related from the same City**

```
select * from account_holder a where exists (select 1 from account_holder b where a.city = b.city and a.acc_holder_id <> b.acc_holder_id);
```

- **Write a query to fetch account number and account holder name, whose accounts were created after 15th of any month**

```
select account_no, acc_holder_name from account_holder where day(date_created) > 15;
```

- **Write a query to display the city name and count the branches in that city.**

**Give the count of branches an alias name of Count\_Branch.**

```
select branch_city, count(branch_id) as count_branch from bank group by branch_city;
```

- **Write a query to display the account holder's id, account holder's name, branch id, and loan amount for people who have taken loans. (NOTE : use sql join concept to solve the query)**

```
select ah.acc_holder_id, ah.acc_holder_name, l.branch_id, l.loan_amount from account_holder  
ah inner join loan l on ah.acc_holder_id = l.acc_holder_id;
```
